UseCase *Update Shift Availability*

Employee information can be updated to include when an employee is and is not able to work. This will prevent shifts from being assigned at times where the employee is unavailable.

UseCase *Update Supervisor Permissions*

Permissions allow supervisors to be created with only partial access to the features at that level, such as being able to view and print reports, but not add/disable employees.

UseCase *View All Schedules*

Managers will be able to view the shift schedules for all employees and groups, outside of the employees they are directly responsible for.

UseCase *View Workgroup Schedule*

Supervisors will be able to view not only their personal schedules, but also the full schedules of all employees that they are in charge of.
